FWF2 - New employee best match

There is a request from an HR company to create a process that would help with picking the best match applicants for specific jobs.

There is a mapping file used to match required skills and experience to each job type.

The CVs are sent via email and there are three accepted formats. Each incoming CV goes into a job specific folder. The documents should be classified and then the relevant information such as skills and experience should be extracted.

After the data is extracted from the document, a formula is applied to determine how fit is the candidate for the desired position and in the end, a list with the top 10 candidates for each job is sent over email

FutureWorkForce

Overview

- Input: job/requirements mapping file, CV received on email

- Output: email containing employee ranking

- Applications used: Outlook/Gmail, Excel

- Technologies to be used: Document Understanding Framework

| Get input mapping data | Get documents from email | Document classification | Extract information | Rank employees |
